Abstract

Background: Patients at a community hospital verbalized fear, stress and anxiety about transcatheter aortic valve replacement (TAVR). Patients with aortic stenosis eligible for TAVR may experience low self-efficacy and anxiety while considering valve replacement which may lead to poor quality of life, interfere with understanding information from medical providers, and other health complications.

Methods: All patients eligible for TAVR between June and August of 2019 were invited to participate in a pilot project using peer support and use of shared decision-making (SDM) aids. Former TAVR patients were trained to be Mended Hearts TAVR peer volunteers. Participants were connected by telephone with a peer by the valve coordinator and SDM aids from the American College of Cardiology were initiated and reviewed during appointments. Patients’ anxiety and self-efficacy were measured before and after peer support using the General Anxiety Disorder-7 and the Cardiac Self-Efficacy scales. Patients evaluated the helpfulness of the SDM aids using the Preparation for Decision-Making scale and open-ended questions were used to gather additional information beyond questionnaire scale questions.

Results: Eleven TAVR patients evaluated anxiety and CSE and twelve patients evaluated the SDM aids. Post-GAD-7 scores showed four patients had a decrease in anxiety, five had no change, and two had an increased anxiety score. Post CSE scores showed increases in confidence for 58% of patients in one or more areas of self-efficacy and all patients rated the SDM aids as ‘somewhat to a great deal helpful’. All patients responded positively during interviews, stating that even if they felt confident before the interventions, they felt even greater confidence afterwards.
Conclusion: The interventions empowered patients to discuss their health and procedural concerns and personal values with their medical team. Patients feel more confident with their decisions regarding TAVR after receiving peer support and the shared decision-making aids.

Key Words: Peer Support, Shared Decision-Making, Transcatheter Aortic Valve Replacement (TAVR), Aortic Stenosis
Goals and Vision of the Program

Patients with aortic stenosis, eligible for transcatheter aortic valve replacement (TAVR), may experience low cardiac self-efficacy and anxiety while waiting for treatment decisions. A referral for TAVR and completing the workup process does not equate approval for TAVR. Determining eligibility is a multidisciplinary team approach with a complex shared decision-making process engaging patient values, consideration of health history, quality and length of life outcomes before final recommendations are made. During the shared decision-making (SDM) process, patients must cope with the knowledge of a poor life expectancy without valve replacement, knowledge of potential procedural risks, and the possibility of being declined TAVR.1 The uncertainty during the workup process may lead to low self-efficacy and anxiety, which in turn may result in insomnia, a decrease in quality of life, an increased need for anesthesia, increase in pain medications and interference with understanding and following instructions from medical providers.2

Patients at a community hospital verbalized their fear, stress and anxiety about needing and making decisions about valve replacement during TAVR work up appointments. A pilot project was designed and implemented to evaluate peer support and use of SDM aids with the TAVR population to address these issues (Appendix A). The aims of the project were to:

- Decrease anxiety and increase self-efficacy in patients pursuing TAVR through peer support.
- Integrate shared decision-making aids into the TAVR shared decision-making process and evaluate the patient perception of the usefulness of the SDM aids.
Local Challenges in Implementation

While limited evidence regarding the use of supportive interventions is available with the TAVR population, evidence does exist for supportive interventions in the open-heart surgery population (Appendix B). Open-heart patients have benefited from peer support and it was speculated that similar support might be helpful with the TAVR population. The local Mended Hearts chapter, a national cardiac peer support group, provides face-to-face support at the project site for open-heart patients; however similar support was not previously available for TAVR patients. Peers for patients pursuing TAVR needed to be identified, recruited, trained, and a pathway for support identified.

The use of SDM aids in the general population has been found to decrease patient anxiety, lead to faster recoveries, increase compliance with treatment recommendations, provide information on the health condition, treatment options, and provide patients a platform for sharing personal values. The Center for Medicare and Medicaid (CMS) requires SDM in the aortic stenosis population pursing TAVR, yet there is little information in the literature (Appendix B) from TAVR patients regarding the usefulness of SDM aids in assisting with the decision-making process. SDM aids needed to be identified and integrated into the current TAVR process.

Design of the Initiative

All patients eligible for TAVR between June and August of 2019 were invited to participate in the pilot project. A logic model provided the framework for organizing the planning, implementation, and evaluation of the project (Appendix C). To evaluate the effectiveness of the interventions, patients rated their anxiety level using the General Anxiety Disorder-7 (GAD) scale (Appendix D) and their perceived cardiac self-efficacy using the Cardiac Self-Efficacy (CSE)
scale (Appendix E) before and after peer support. The Preparation for Decision Making Scale (Appendix F) was used to evaluate the helpfulness of the SDM aids and was completed by patients after use of the aids. Open-ended interview questions were used to collect information beyond the select answers available on questionnaire scales (Appendix G). Interview questions allowed patients to express, in their own words, their experience with the interventions. To mitigate potential conflicts of interest, and to ensure the project protected participants, the project was submitted to the medical center’s Institutional Review Board and designated as exempt (Appendix H).

**Peer Support**

The valve coordinator recruited past TAVR patients to be peers. Peers were required to participate in training by the local Mended Hearts chapter and to become members. Training included information on listening skills, patient privacy, how to share one’s personal experience, and instructions not to provide medical advice. Once it was determined that a new patient was a TAVR candidate, the coordinator connected the patient with a peer. Support was provided by telephone before the procedure, rather than face-to-face as to not burden new TAVR patients with additional appointments during the workup process. TAVR peers were asked to record the number of attempts to reach a patient and the number of minutes providing support so that insight could be gained regarding the time required to provide support.

**Shared Decision-Making Aids**

Patients with aortic stenosis have three treatment options to consider: surgery, TAVR, or medical therapy. The shared decision-making aids *Treatment Options for Severe Aortic Stenosis for Patients Deciding Between TAVR and Surgery* (Appendix I) and *Treatment Options for Severe Aortic Stenosis, TAVR vs. Symptom Management* (Appendix J) were used. The aids are
produced and endorsed by the American College of Cardiology and present information with side by side comparisons of the risks and benefits of each therapy option. For the pilot project, both aids were presented to all patients and reviewed with patients during their consultation appointment.

**Implementation of the Initiative**

**Peer Support**

The coordinator randomly selected six past TAVR patients, whose procedure was completed within the last one to two years, and invited them to participate as peers in the project (Appendix K). Four patients agreed to attend in-person training from Mended Hearts. One patient was not able to participate due to health complications, one attended the training but declined to participate and the remaining two patients completed training and became Mended Hearts TAVR volunteers. The Mended Hearts training session provided at the medical center took approximately 60 minutes. TAVR volunteer peers were provided with a list of topics to discuss with new patients, such as managing aortic stenosis symptoms while awaiting TAVR, personal experience with the workup process, including hospital stay, procedure details, and the recovery process.

Twelve patients were considered for TAVR during the project timeframe and all agreed to participate. There were an equal number of men and women participants. The majority were married (75%) and their ages ranged from 63 to 89 years old. Participants were provided with information regarding the project, signed a consent, and were offered both interventions (Appendix L). The coordinator obtained verbal permission to connect the patient with a peer and then provided the TAVR peer with the new patient’s phone number to initiate contact and support.
Shared Decision-Making Aids

The SDM aids were introduced at the first contact with the new patient before consultation with the interventional cardiologist or cardiac surgeon. The coordinator conducted a frailty assessment at these appointments for all patients and it felt natural to introduce the aids at this time. Patients were provided with a brief education about aortic stenosis treatment options with the information provided in the SDM aids prior to consulting with the physicians. The coordinator answered questions about the treatment options and/or indicated that the questions would be further discussed during the consult with the physicians. As the aids were used to enhance the education already being provided during the frailty assessment, it added minimal additional time to the assessment.

Success of the Initiative

Peer Support

TAVR peers were able to connect with new patients on the first attempt 45% of the time, 36% on the second attempt, 18% on the third attempt. One person was unable to be reached. Peers provided support by phone for an average of 14 minutes per participant. TAVR peers shared that patients asked questions about pain, the hospital stay, what the procedure was like, and the recovery process. One peer felt skeptical at first about whether or not new patients would want to talk to him, but felt the pre-introduction given by the coordinator helped open the door for conversation. The TAVR peers expressed a personal sense of gratification in being able to give back to their community and help others feel more confident about a procedure.

After receiving peer support, new patients provided feedback. Post-GAD-7 scores showed that four patients had a decrease in anxiety, five had no change, and two had an increased score (Figure A). Of the two patients with an increase in anxiety, outside factors may
have influenced the score as one received news of a health complication that delayed the TAVR procedure and the other had recent news of a personal family complication. Post CSE scores showed small increases in confidence for 58% of the patients in one or more areas of self-efficacy (Figure A).

While questionnaires showed minimal or no decrease in anxiety and a minimal increase in self-efficacy, interviews provided further insight into the impact of the interventions. All patients responded positively when asked, “Tell me about your experience with peer support.” Patients relayed they felt more confident about moving forward with a procedure, felt less anxious about the procedure, and felt they had increased knowledge regarding the procedure and recovery process (Figure B). All patients recommended that future patients have the opportunity to speak with a peer who has been through the TAVR process.

Another positive outcome of this project is that the TAVR peer volunteers have both independently decided to pursue advanced Mended Hearts training. This training will allow them to offer support in the hospital setting. The TAVR volunteers are becoming active members of the local Mended Hearts chapter and will assist in recruiting and training future TAVR peers.

**Shared Decision-Making Aids**

Patients were asked to reflect on their visits with the surgeon and cardiac interventionalist and evaluate the SDM aids. Patients in the pilot project found the aids were ‘somewhat’ to ‘a great deal helpful’ in assisting them to be more prepared for appointments, promoting discussions with their doctor, and increasing their confidence in the decision-making process (Figure C). Interview responses also indicated that the aids helped patients discuss their options with their doctor. For example, one patient stated, “I would have been lost without the shared decision aid,” and it helped me “open up more” about concerns regarding treatment options
(Figure B). As low surgical risk eligibility for TAVR was approved by CMS shortly after implementation of the project, it has led to an easy transition of sharing the SDM aid with all aortic stenosis patients at the pilot site.

**Translation to Other Settings**

Peer support and the use of SDM aids are cost-effective and resource-friendly interventions that could be implemented at other valve centers (Appendix M, N, O). While the pilot project relied on the coordinator to connect peers and educate patients on the SDM aids, the time commitment was minimal. In addition to the coordinator, other ancillary staff could assist in connecting peers and SDM aids could be integrated into the care process by other members of the healthcare team such as the cardiac surgeon, interventional cardiologist, or general cardiologist. While not all valve centers may have an existing Mended Hearts chapters, peer support can be accessed through support outreach programs provided by one of the valve companies. Patients could be provided with the contact information for these resources at their appointments. The SDM aids for aortic stenosis are easily accessible for use and printing from the American College of Cardiology CardioSmart website (https://www.cardiosmart.org/SDM/Decision-Aids).

**Summary of the Experience, Future Direction and Challenges**

Coping with aortic stenosis and needing valve replacement is an uncertain and vulnerable time for patients. Peer support and use of the SDM aids empowered patients to be active participants in the decision-making process. As all aortic stenosis patients now have the option to be TAVR candidates, and more transcatheter based procedures, with similar stressors, will be available for other heart valves in the future, SDM and peer support becomes even more important as more treatment options are available. All patients needing transcatheter based care
will need similar support as the TAVR population. While further studies should be done to
define the benefits of peer support in the TAVR population and validate the SDM aids, the
benefits were sufficient to continue the interventions at our facility. Future direction for our
program will include continued peer support into the post procedure recovery period and
building peer support and use of SDM aids into pathways for all patients who are candidates for
any new transcatheter based therapies as they become available.

#### B  Commonalities of Patient Responses to Interview Questions

**Tell me about your experience with TAVR peer support (n=11)**

- Felt more confident about moving forward with procedure: “Good to have a past patient to talk to, even if you are not concerned about it yourself” & “Reassuring to talk to someone who had recently been through it, you don’t have to be anxious and it helps keep your blood pressure down”
- Connected with peer over having multiple health problem: “If she can do it, I can do it”
- Felt less anxious about the procedure: “It’s ok to be nervous about things”
- Increased knowledge regarding procedure and recovery process: “They’ve done it and you haven’t”

**How did the use of a decision aid enable you to engage with your physician during the TAVR work up the process? (n=12)**

- Felt more informed that a decision needed to be made and clarified options: “I was able to open up more about concerns about options when talking with the doctor” & “It helped quite a bit”
- Better understanding of what the physician was explaining regarding treatment options: “I would have been lost without the SDM aid” & “Gained more organization with the question to ask physician”

| 2 | Colella & King-Shier (2018) | I | **Location study:**
Toronto, Canada  
**Sample Size:** 185  
61 peer support  
124 usual care  
**Setting:**
community | Peer support provided by telephone three to four-day post op and weekly for six weeks post-surgery by a peer. Compared to control group no effect on depression scores. Intervention group (peer support) showed lower uses of health service and ER utilization. The authors conclude this leads to decreased health cost and may have assisted patients in early problem identification and problem solving. Volunteers were recruited by poster at cardiac rehab program & hospital, and by letter to past CABG patients. Volunteer trained by researcher on communication skills, recovery norms, and when to refer patient to nurse practitioner for medical help. | Self-reported measure relies on patient’s ability to identify and share health information. Patients may under or over rate their symptoms leading to scoring challenges. | B |
| 3 | Esmaeili, Jannati, Ghafari, Charati & Jelodar (2015) | I | **Location of Study:**
Mazandaran Heart Center, Iran  
**Sample size:** 3 groups of 50 people  
All groups received usual education, in the Peer education group, peer education was added & in the orientation group they received the OP program, first time CABG patients | Mean anxiety score was not significant between groups one day prior to surgery, but one hour prior to surgery the peer support group and orientation group were lower than the control group, but no statistical significance between peer education and orientation group. "peer education group members communicate better with their peers (patients) and encourage them to conduct themselves in suitable healthy behaviors, since they can share their weak and strong points as well as experiences at negligible or no cost" Supporting peers enable patient to be more mentally prepared for surgery. Orientation program assist patients by educating them on the hospital and surgical experience and may walk them through the hospital setting where they will receive care  
In the non-intervention group anxiety significantly increased one hour prior to surgery. | Does not say who provided the orientation program. Medical staff. While overall sample size 150, there are only 50 people in each of the two intervention groups. | B |

Themes identified: peer support, friendship, information exchange, acceptance and control, comparing self to others, depression, effectiveness of program materials. Poor group attendance, low functional health status.

For some, peer support provided hope for living with heart failure & felt it provided extra emotional support. For some, they felt too ill to participate and did not feel the type of support to navigate ill health was offered, these people were less engaged in the peer support.

Patients found value in talking to peers who were living with the same health condition, even if they had great family support. The peer was offered provided a greater level of emotional support of "understanding what it is like". Lessened feeling of being alone. "Many participants who developed friendships with their peers’ partners reported taking better care of themselves and being able to better manage their HF". Patients found peers were able to clarify information they had received from doctors promoting better self-management of health. Engaging with peers increased confidence comfort and reassurance, feeling of

While study does not specifically address anxiety, it provides good information about what patient gain by participating in peer to peer support programs.
being inspired. Support was provided by NP led group, and/or peer to peer telephone. Those in the study attended two or more group session and/or participated in 17min or more telephone support.

|   | Study Location | Sample Size | Setting | Study | Location of Study: Poland | Sample Size: 48 women mean age of 66 | 23 women had cardiac surgery 25 women had breast cancer treatment with mastectomy Setting: Community Study used existing peer support group. Oncology group had high acceptance of disease than cardiac both groups showed social support was associated differently to parameters of emotional state. Women treated for breast cancer were in better mental shape than those with cardiac disease. Support from women with cancer in the mastectomy group was more effective than usual social support the women had. In Wroclaw there is an established social support group for "Women After Mastectomy Club". While women's heart disease receives much less attention. 1. Both groups experienced high levels of anxiety 2. Support from women with a similar experience is more effective than usual support circle and influence how women cope and accept their disease. Study done in Poland. May have different cultural values that could influence perception of illness, quality of life and anxiety when compared to the US population Small study sample. No information on how often patient attended group. |

<td>Study describes the process of developing a decision aid to increase knowledge and shared decision making for patients with rheumatoid arthritis. Patients and clinicians who were a part of the team that developed the aid. Both gave feedback on the content, visual appeal and use of the DA as it was being developed. Information was obtained through interviews of clinicians &amp; patients. The DA went through three drafts during field-testing. The aid focused on medication issues and patient goals. Cards led to providers increasing discussion and consideration of patient preferences in their care.</td>
<td>Does not measure increase in knowledge or SDM</td>

If you checked off any problems, how difficult have these made it for you to do your work, take care of things at home, or get along with other people?

- Not difficult at all
- Somewhat difficult
- Very difficult
- Extremely difficult

Appendix E

The Cardiac Self-Efficacy (CSE) Questionnaire

The CSE uses a 13-item Likert-scale to measure patient’s cardiac confidence. The items are rated 0 through 4 (0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident) or may select “not applicable”.

How confident are you that you know or can:
1. Control your chest pain by changing your activity level
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

2. Control your breathlessness by changing your activity levels
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

3. Control your chest pain by taking your medications
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

4. Control your breathlessness by taking your medications
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

5. When you should call or visit your doctor about your heart disease
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

6. How to make your doctor understand your concerns about your heart
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

7. How to take your cardiac medications
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

8. How much physical activity is good for you
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

9. Maintain your usual social activities
   0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

10. Maintain your usual activities at home with your family
    0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

11. Maintain your usual activities at work
    0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

12. Maintain your sexual relationship with your spouse
    0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

13. Get regular aerobic exercise (work up a sweat and increase your heart rate)
    0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident

IRB Approval Letter

System Institutional Review Board

DATE: March 5, 2019

TO: Kimberlee Einfield, MN RN

FROM: System Institutional Review Board

PROJECT TITLE: [1384874-1] Reducing Anxiety and Increasing Self-Efficacy in the TAVR Population:

REFERENCE #: [1384874-1]

SUBMISSION TYPE: New Project

ACTION: DETERMINATION OF EXEMPT STATUS

DECISION DATE: March 5, 2019

REVIEW CATEGORY: Exemption category 3: Research involving benign behavioral interventions in conjunction with the collection of information from an adult subject through verbal written responses (including data entry) or audiovisual recording if the subject prospectively agrees to the intervention and information collected

Thank you for your submission of New Project materials for this project. The Institutional Review Board (IRB) has determined this project is EXEMPT FROM IRB REVIEW according to federal regulations.

This determination of exemption shall be effective indefinitely. Modifications may not be made to exempt research because of the possibility that proposed changes may change the research in a way that it no longer meets the criteria for exemption. A new application for exempt determination must be submitted and reviewed prior to modifying the research activity, unless the investigator believes that the change must be made to prevent harm to participants. All such changes must be reported to the System IRB.

We will retain a copy of this correspondence within our records. If you have any questions, please contact the IRB with your project title and reference number. The IRB is covered under Human Subjects Assurance number FWA 00003906.
Appendix I

Treatment Options for Severe Aortic Stenosis for Patients Deciding Between TAVR and Surgery

This booklet will help you understand what aortic stenosis (AS) is and what treatment options are available. You, your family, and your clinicians can begin to discuss which treatment option is best for you.

¿Along the way, we want you to think about:

- What your goals are for treating your AS
- What concerns you have about your treatment options
- What additional questions you have for your clinician
UNDERSTANDING AS

Aortic Stenosis (AS) is tightening of the aortic valve in the heart. This can get worse over time. AS makes it harder for the heart to do its job.

SYMPTOMS OF SEVERE AS INCLUDE:
- feeling dizzy like you might pass out
- feeling tired
- trouble breathing
- chest pain
- swelling of the legs

You may be experiencing some of these symptoms. They may make it harder to do the things you want to do. If left untreated, these symptoms usually get worse over time and can lead to death. Prior to the decision, you may need to have additional testing to help your clinician understand what your options are.

What options do I have to fix my valve?

THIS IS THE BIG QUESTION!

FIXING YOUR VALVE: Most people decide between two different procedures: TAVR and SAVR. The rest of this brochure will help you understand these options.

Sometimes people do not fix their valve right away, often because:

1. They aren’t sure their symptoms are from AS. Other common problems share a lot of symptoms with AS, including:
   - Being out of shape
   - Cancer
   - Depression
   - Arthritis
   - Kidney disease
   - Lung disease
   - Other heart disease
   - Alzheimer’s

2. They have more urgent health care needs, such as:
   - Serious infections
   - Cancer

Treatment Options for Severe Aortic Stenosis for patients deciding between TAVR and Surgery INTERMEDIATE OR HIGH SURGICAL RISK

CardioSmart American College of Cardiology
TREATMENT OPTIONS

**TAVR**
Transcatheter Aortic Valve Replacement
transcatheter procedure

**WHAT:**
TAVR is a procedure where a new valve is placed in the heart through a small tube (called a “catheter”) typically in the leg.

**HOW:**
This procedure involves a small incision where a catheter is inserted to access the heart to replace the valve.

**WHO:**
This method is an option for both patients who are and those that are not candidates for open-heart surgery.

**HOSPITAL STAY:**
On average, 2-3 days

**RECOVERY TIME:**
On average, 1-2 weeks

**VALVE TYPE:**
A bioprosthetic valve is used

**SAVR**
Surgical Aortic Valve Replacement
open-heart surgery

**WHAT:**
SAVR is open-heart surgery where a new valve is placed in the heart directly, replacing the old valve.

**HOW:**
This surgery usually involves an incision along the breastbone to access the heart to replace the valve.

**WHO:**
Those without other severe health problems are good candidates for open-heart surgery.

**HOSPITAL STAY:**
On average, 1 week

**RECOVERY TIME:**
On average, 6-8 weeks

**VALVE TYPE:**
A bioprosthetic valve or mechanical valve is used

*Every patient is different, and we cannot see into the future to know how long your new valve will last. At this time, we know more about how long surgically replaced valves last than we do about TAVR valves. While valve replacements are durable, eventually your new valve may need to be replaced. The timing of this is different for every patient. Talk to your clinician about any concerns you have about how long your valve might last, and what your options might be if it ever needs to be replaced.*
THE RISKS & BENEFITS OF YOUR OPTIONS
TAVR vs. SAVR: Which is the best decision for me?*

*Tzou et al. (2010), New England Journal of Medicine; Huard et al. (2013), New England Journal of Medicine

**BENEFITS:**
- Helps you live longer
- Helps you feel better
- Less invasive procedure
- Shorter recovery time

Nearly 9 in 10 patients are still living within two years and just over 1 in 10 patients will die.

86% live 14% die

**RISKS:**
- Nearly 1 in 10 patients suffer from a stroke within 2 years
  - 8%
- Nearly 1 in 10 patients suffer from serious injury to blood vessels
  - 9%
- 2 in 10 need a pacemaker within 2 years
  - 20%

Both TAVR and SAVR have POTENTIAL PROCEDURAL RISKS including:
- Death
- Heart attack
- Bleeding
- Infection
- Stroke
- Blood clots

These risks are different for different patients. Talk to your doctor about your individual risks.

**SAVR**

**BENEFITS:**
- Helps you live longer
- Helps you feel better
- Over 50 years of experience with procedure

Just over 9 in 10 patients are still living within two years and just over 1 in 10 patients will die.

85% live 15% die

**RISKS:**
- Nearly 1 in 10 patients suffer from a stroke within 2 years
  - 8%
- Less than 1 in 10 patients suffer from serious injury to blood vessels
  - 6%
- 1 in 10 need a pacemaker within 2 years
  - 10%

**IN SUMMARY:**
- TAVR and SAVR are each effective options for helping your aortic valve
- TAVR is a less invasive procedure
- The risk for needing a pacemaker implanted is higher after TAVR
- More is known about how long mechanical valves last (used in SAVR)
**TREATMENT SCENARIO 1**

- **JANE IS AN 80-YEAR-OLD WOMAN WITH SEVERE AS.**
- She also has moderate lung disease and diabetes.
- She has shortness of breath when she walks across a room.
- Her clinician thinks it might be related to her aortic valve. Jane talked to her clinician to better understand the risks and benefits involved with her options.

---

**Option 1: Choose TAVR**

- TAVR is less invasive.
- The recovery time is shorter.
- Jane can expect similar results.

**Option 2: Choose SAVR**

- TAVR is a newer procedure, while SAVR has been around for a long time.
- Jane knows people who have had open-heart surgery.

---

After talking to her clinician, Jane decided the **TAVR procedure was the best option** for her. She is concerned her other illnesses will make recovering from open-heart surgery more difficult.
TREATMENT SCENARIO 2

- Elroy is a 78-year-old man with severe AS whose symptoms are starting to get in the way of his daily activities.
- He also has diabetes and history of a heart attack.
- He talked to his clinician to better understand the risks and benefits of his treatment options.

Option 1: Choose TAVR

- TAVR is less invasive.
- The recovery time is shorter.
- Elroy can expect similar results.

Option 2: Choose SAVR

- TAVR is a newer procedure, while SAVR has been around for a long time.
- Elroy knows people who have had open-heart surgery.
- Elroy decided the SAVR procedure was the best choice for him. He wanted a valve that is known to last and he wasn’t concerned about the longer recovery time.
MAKING YOUR DECISION

TAVR and SAVR are each effective options for helping your aortic valve; the choice is ultimately a very personal one based on your overall health, values and individual preference.

There is a lot to think about when trying to decide which path is right for you. Take some time to consider what you have learned about treatments for AS. If you’re still not sure what the best choice is for you, ask yourself these questions.

What do you hope for with TAVR or SAVR?

What concerns do you have with TAVR or SAVR?

What questions do you have for your clinician?

What questions do you have for your family and loved ones?
Appendix J
Treatment Options for Severe Aortic Stenosis TAVR vs. Symptom Management

A DECISION AID FOR TREATMENT OPTIONS FOR SEVERE AORTIC STENOSIS (TAVR vs Symptom Management)

For Patients With Prohibitive Surgical Risk/Inoperable

This booklet will help you understand what aortic stenosis (AS) is and what treatment options are available. This booklet is specifically for individuals who cannot have open-heart surgery. You, your family, and your clinicians can begin to discuss which treatment option is best for you.

Along the way, we want you to think about:
- What your goals are for treating your AS
- What concerns you have about your treatment options
- What additional questions you have for your clinician
**UNDERSTANDING AS**

Aortic Stenosis (AS) is tightening of the aortic valve in the heart. This can get worse over time. AS makes it harder for the heart to do its job.

**SYMPTOMS OF SEVERE AS INCLUDE:**
- feeling dizzy like you might pass out
- feeling tired
- trouble breathing
- chest pain
- swelling of the legs

You may be experiencing some of these symptoms. They may make it harder to do the things you want to do. If left untreated, these symptoms usually get worse over time and can lead to death. Prior to the decision, you may need to have additional testing to help your clinician understand what your options are.

**Will Treatment Help? THIS IS THE BIG QUESTION!**

If symptoms are from severe AS, fixing your aortic valve may help you feel better and live longer.

If symptoms are from OTHER health problems, fixing your aortic valve may NOT help you feel better OR help you live longer.

It is important to understand whether treatment for severe AS will help you feel better and/or live longer.

Discuss your symptoms and what could be causing them.
TREATMENT OPTIONS

**TAVR**
Transcatheter Aortic Valve Replacement
Transcatheter Procedure

**WHAT:**
TAVR is a procedure where a new valve is placed in the heart through a small tube (called a “catheter”) typically in the leg.

**HOW:**
This procedure involves a small incision where a catheter is inserted to access the heart to replace the valve.

**WHO:**
This method is an option for both patients who are and those who are not candidates for open-heart surgery.

**HOSPITAL STAY:**
On average, 2-3 days

**RECOVERY TIME:**
On average, 1-2 weeks

**SYMPTOM MANAGEMENT**
Taking Medication Only

**WHAT:**
Partnering with your clinician to try and control symptoms with medications, without fixing the valve.

**HOW:**
This option involves using medications that will not prolong life but may limit the symptoms of severe AS.

**WHO:**
This method is an option for patients who do not wish to have surgery or have too many other health problems that are not related to severe AS.

**HOSPITAL STAY:**
No procedure that involves a hospital stay.

**RECOVERY TIME:**
No procedure to recover from
MORE INFORMATION ON YOUR TREATMENT OPTIONS FOR AS — BENEFITS

What is palliative care?

Palliative care is medical care for people with serious illness. It helps provide relief from symptoms, pain and stress. It also provides emotional and spiritual support. The goal of palliative care is to improve quality of life for patients and caregivers.

What is hospice?

Hospice is care given by health professionals for patients near the end of their lives. This care includes medical, emotional, and spiritual support, and helps to provide comfort and quality of life for patients. Hospice care usually occurs within a patient’s home. It can also occur in other settings such as a hospice facility or nursing home.

Whether you decide TAVR or Symptom Management is the right choice for you, there are services available to help with symptoms and suffering of advanced illness.

A decision aid for Treatment Options for Severe Aortic Stenosis (TAVR vs Symptom Management) FOR PATIENTS WITH PROGRESSIVE SURGICAL RISK/INOPERABLE
TREATMENT SCENARIO 1

JANE IS AN 80-YEAR-OLD WOMAN WITH SEVERE AORTIC STENOSIS.

- She also has moderate lung disease and diabetes.
- She has shortness of breath when she walks across a room.
- Her clinician thinks it might be related to her aortic valve. Jane talked to her clinician to better understand the risks and benefits involved with her options.

**Option 1: TAVR**

The majority of Jane’s symptoms are from severe AS. Replacing her valve would likely improve her symptoms and may also extend her life.

**Option 2: Symptom Management**

Replacing her valve won’t fix all of Jane’s symptoms. Jane is concerned about some of the risks that can happen with the TAVR procedure. Jane is worried her other illnesses like diabetes may continue to get worse.

After talking to her clinician, Jane decided the TAVR procedure was the best option for her. She hoped replacing her valve would improve her symptoms caused by AS and help her feel better.
TREATMENT SCENARIO 2

**Option 1: TAVR**

TAVR might help some of George's symptoms.

**Option 2: Symptom Management**

Replacing his valve might NOT help George's symptoms. George will still have symptoms of heart failure and difficulties from his stroke. George is more concerned with symptom management than aggressive treatment at this time.

After talking to his clinician George decided **Symptom Management** was the best choice for him. He and his family are not sure TAVR will help him with his symptoms and he does not want any more procedures.
Appendix K

Telephone Requirement Script

Past TAVR Patient to invite them to become Mended Hearts Members and Participate in the SP Pilot Project

Hello Mr./Ms Name of Patient

This is Kim, your TAVR coordinator. I am a student at Boise State University in the Doctor of Nursing Practice. As part of my program, I am working to assist our local Mended Hearts chapter to develop support for patients who are going to have or are trying to decide if they should have the TAVR procedure.

I am calling to ask if you would be interested in sharing your experience with having a TAVR with someone else that in the workup process for TAVR and becoming a member of the local Mended Hearts Chapter. This is an opportunity for you to share your experience with TAVR, give back to our community, and improve our TAVR program.

If the patient states yes:

If you are willing to be a peer support partner for TAVR you will:

- Become a Mended Hearts Member
  - Cost of the first year Member Hearts membership as a TAVR patient will be waived as we are trying to build TAVR patient members
- Complete Mended Hearts training in person or online to learn how to provide peer support
  - You are invited to attend an in-person training session. This session will take approximately 60 minutes.
  - If you do not have a computer, you can come to the Cardiac Office, and I will help you gain access to a computer and complete the training.
  - While Mended Hearts volunteers do one to one visit in the hospital, this requires additional volunteer training with the hospital. At this time, only training through Mended Hearts is needed to be able to contact people by phone.
- Be available to call a new TAVR patient
  - You may be asked to contact 2 to 4 new patients a month by phone
  - This phone call will take about 15 to 20 minutes
  - During your phone call, it is recommended you share
    - Your experience with the TAVR work up process
    - Your experience with managing your aortic stenosis symptoms while waiting for TAVR
    - Your experience with the TAVR procedure
    - Your experience with the hospital stay
    - Your experience with the TAVR recovery process
- As TAVR peer support is new for our Mended Hearts chapters, I will have you:
  - Track the number of times it takes you to contact the new TAVR patient
o Track the number of minutes you spent sharing your experience with the new TAVR patients

You may decline to become a Mended Hearts member and participate in this program. If you would like to become a Mended Hearts member and participate in this program or learn more about this opportunity, you can come to a meeting with myself and a current Mended Hearts member on (Date to be determined). We will meet in the cardiac surgery office.

If you would like to think about it and get back to me, you can call me at [redacted].

Thank you for your time.
Appendix L

Patient Consent to Participate in Project

CONSENT TO PARTICIPATE IN PILOT PROJECT

Reducing Anxiety and Increasing Self-Efficacy in the TAVR Population: Implementation of an Enhanced TAVR Care Coordination Model Pilot Project

Kimberlee Einfeld, Master in Nursing, from the Cardiothoracic Surgery clinic at PeaceHealth is conducting a pilot project.

You were selected as a possible participant in this study because your doctor has recommended you as a possible candidate for TAVR. Your participation in this project is voluntary.

Why is this study being done?

The purpose of this project is to help patients feel less anxious and have more confidence about managing their aortic stenosis symptoms while in the work up process for TAVR, about the TAVR procedure, and in making decisions about treatment options.

What will happen if I take part in this pilot study?

If you volunteer to participate in this study, the researcher will ask you to do the following:

- Be given written information about TAVR and symptom management. This is called a Shared Decision-Making Tool.
  - The TAVR Coordinator and/or Interventional Cardiologist will take approximately 10 minutes to review this information with you at your clinic visit
- You will be asked to complete a survey rating Shared Decision-Making Tool. This survey allows you to share your opinion on how useful or not useful you felt this tool was.
- Connect with a Mended Hearts volunteer who has had TAVR. This is called peer support. This will be done by phone and take about 10 to 15 minutes. You will be asked if you would like the volunteer to call you or if you would like to be the one to call the volunteer.
  - The volunteer will share with you:
    - What it was like to manage their aortic stenosis symptoms while waiting to hear if they would be able to have TAVR.
    - What the work up process for TAVR was like.
    - What the TAVR procedure was like.
    - What it was like to go home after TAVR.
- You will be asked to fill out two surveys before you connect with the Mended Hearts volunteer and again after you talk to the volunteer
  - The surveys will ask you to rate
    - Survey two will ask you to rate your confidence level taking care of your heart health
Survey three will ask you to rate
- An interview approximately 10 to 15 minutes by phone or in person at the clinic with the TAVR coordinator. This allows you the chance to share more about your experience with TAVR peer support and use of the Shared Decision-Making Tool.

How long will I be in the project study?

Participation will last as long as it takes to make a treatment decision for TAVR or symptom management and/or a TAVR procedure is scheduled.

Are there any potential risks or discomforts that I can expect from this study?

I will make every effort to protect your confidentiality. If you are uncomfortable answering any of the interview questions or questions on a questionnaire, you may decline to answer.

In the unlikely event that some of the survey or interview questions make you uncomfortable or upset, you are always free to decline to answer or to stop your participation at any time.

Are there any potential benefits if I participate?

You may benefit from the study by
- A better understanding of your health condition.
- Improved communication with your health care team.
- Decreased anxiety about the procedure and medical treatment decisions
- Increased confidence regarding caring for your heart condition.
- Talk to someone who has been through the process.

The results of the project may help improve the TAVR program and improve the experience for future patients who will need a new aortic valve by the TAVR procedure.

Will information about me and my participation be kept confidential?

Any information that is obtained in connection with this study and that can identify you will remain confidential. It will be disclosed only with your permission or as required by law. Confidentiality will be maintained by means of not including your name will not be used in any written reports or publications, which result project. Also, the organization will not be named in any written reports or publications.

Any surveys you answer will not include your name. Your answers for surveys or interview questions will be stored in a secure computer and only be accessible by the project coordinator and by the project sponsor.

What are my rights if I take part in this study?
• You can choose whether you want to be in this study, and you may withdraw your consent and discontinue participation at any time.
• Whatever decision you make, there will be no penalty to you, and no loss of benefits to which you were otherwise entitled.
• You may refuse to answer any questions that you do not want to answer and remain in the study.

Who can I contact if I have questions about this study?

• **The project team:**
  If you have any questions, comments or concerns about the project, you can talk to the one of the project coordinators. Please contact:

  *Kimberlee Einfeld MN, PCCN-K, RN* [Contact Information]

• **PeaceHealth System Institutional Review Board:**
  If you have questions about your rights while taking part in this study, or you have concerns or suggestions and you want to talk to someone other than the researchers about the study, please call the IRB at [Contact Information].

*You will be given a copy of this information to keep for your records.*

Theoretical Model

Bandura’s self-efficacy theory was selected as a theoretical framework as it brings together identifying and describing the phenomena of coping and stress and provides a format for evaluating why the phenomena occur (Lazarus & Folkman, 1987). Self-efficacy is a social-cognitive theory that was developed in 1977 by Albert Bandura. Self-efficacy is a person’s belief about how they can overcome stressful event, cope with a life challenge or perceived threat (Bandura, 1994). High perceived self-efficacy is the thinking that one can overcome a challenge and leads to more positive thoughts about good outcomes from a procedure, while low self-efficacy, thoughts about not being able to cope with a disease process or feeling overwhelmed by needing a heart procedure can lead to poor health outcomes. Low self-efficacy is associated with stress, anxiety, and feelings of helplessness, which can lead to poor health outcomes (Zulkosky, 2009). Improving self-efficacy can assist people in overcoming negative feelings, build confidence and lead to positive health outcomes.

Increasing a person’s self-efficacy leads to being able to overcome the fear and anxiety associated with managing a complex health condition, navigating the health system, increase confidence to be an active participant in treatment decision and having a medical procedure. It promotes quality of life and improved health outcomes. This theory provides a framework for supporting the peer support and use of a decision aid intervention in the pilot project.
Theoretical Model: Bandura’s Self-Efficacy
Appendix E
Memorandum of Understanding

This Memorandum of Understanding (MOU) outlines the terms and understanding between the [University Name], supporting Doctor of Nursing Practice (DNP) student [Name], and the [Partnership Name] to enhance the Transcatheter Aortic Valve Replacement (TAVR) Care Coordination project to include peer support and implementation of a decision aid for the aortic stenosis population in the TAVR work up process.

Background
Aortic stenosis is a progressive disease affecting 1.5 million people in the US, of which a portion are experiencing symptoms of shortness of breath, lightheadedness, and dizziness, chest pain, edema, and decreasing quality of life (Moore, Chen, Mallow & Rizzo, 2018). Once the valve becomes severely stenotic and symptoms develop, there is a death rate of 50% within two years if untreated and the only viable treatment option is replacement (Leon et al., 2010). Valve replacement by open-heart surgery (SAR) or by minimally invasive transcatheter approaches (TAVR) are the only therapies that can relieve symptoms, improve quality of life and decrease mortality (Nishimura et al., 2014; Smith et al., 2011; Svensson, et al., 2013). Patients in Bellingham, Washington pursuing transcatheter aortic valve replacement (TAVR), experience anxiety and are at risk for low self-efficacy related to the ongoing need to manage aortic stenosis symptoms, navigate multiple provider appointments, multiple tests, and make and understand multiple complex medical decisions while waiting for recommendations from the treatment team. During this time they must cope with the knowledge of a poor life expectancy without valve replacement, knowledge of potential procedural risk and the possibility of being declined TAVR and being recommended for medical therapy (Lauck et al., 2018 & Olson, et al., 2016). This uncertainty during the work up process can lead to anxiety and low self-efficacy, which is
associated with poor health outcomes, such as decreased quality of life (Parent & Fontin, 2000 & Windy, Hiltonau, Suhanus & Butzaff, 2004).

The TAVR population is growing due to advances in medicine and changes in eligibility criteria allowing more people to be treated by TAVR. Implementing evidence-based interventions aimed at decreasing anxiety and increasing self-efficacy in the TAVR population has the potential to improve health outcomes, quality of life and patient satisfaction; therefore, these interventions should be sought, implemented and evaluated. This scholarly project will propose peer support and use of a shared decision-making tool as interventions to decrease anxiety and increase self-efficacy in the TAVR population.

Purpose
The purpose of the project is to decrease anxiety and increase self-efficacy, through peer support and use of a decision aid that enhances shared decision-making. The student will engage the local Mendel Hearts chapter and past TAVR patients to develop and implement peer support in the TAVR population. The student will engage the Structural Heart Multidisciplinary team to identify and implement a shared decision making tool to be used during pre-TAVR physician and/or nurse consultations with patients in the work up process. The interventions will be evaluated for their effectiveness and to gain insight from patients into how to improve the TAVR program.

Intended Project Outcomes
The purpose of his pilot project for the TAVR population is to:

- Decrease anxiety for patients while waiting for TAVR.
- Increase self-efficacy for managing aortic stenosis symptoms while in the work up process.
- Provide shared experience through peer support to those pursuing TAVR during the work up process.
- Assist the local Mendel Hearts chapter expand services to TAVR population.
- Implement a decision aid for shared decision making to increase patient knowledge regarding treatment decisions and care pathway for TAVR.

Duration
The Scholarly Project will begin within the organization during December of 2018 and the project will be completed in May of 2020. During this timeframe the student will engage stakeholders of the TAVR programs for planning and development of TAVR peer support and development/identification of a decision aid, implementation of the interventions, evaluation of the interventions, and discrimination of the evaluation findings.

Reporting
The DNP Scholarly Project will include a final report, an abstract, an oral presentation of the report and potential publication. The DNP student will submit a Final Project Report for publication in ScholarWorks. ScholarWorks is a collection of services designed to capture and showcase all scholarly output by the University of Kentucky community, including doctoral dissertations and doctoral project reports. The Enhanced TAVR Care Coordinator Model will be

No personal identifiers will be included, and all data will be reported in aggregate form. The project will be submitted to the IRB for approval. The author welcomes any comments or suggestions from the magnet steering council. The author reserves the right to publish findings and analysis according to professional standards and principles of academic freedom. For any work of a scholarly nature, the author agrees to follow the organization(s) preferences in how it is to be named (or not) in the work. For the final report, abstract, publication and presentation purposes, the student will be referenced in the DNP Scholarly Project as a primary care hospital located in the Pacific Northwest.

## Appendix Q

### Outcome Evaluation Table

<table>
<thead>
<tr>
<th>Outcome</th>
<th>Data Collection Instrument / Data</th>
<th>Analysis Goal</th>
<th>Analytic Technique</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. At the medical center in the Pacific Northwest a structured peer support program is developed for TAVR patients who are in the work up process by May of 2019. (PO)</td>
<td><strong>Instrument:</strong> A Yes/No checklist and activity log will be used to track specific program elements as being completed and implemented. The checklist will quantify the task completed by a yes/no question. The activity log counts the number of meetings, hours, and stakeholders involved to create the program. <strong>Data:</strong> Yes/No questions for checklist developed with the stakeholder team • The TAVR peer support program was implemented by May of 2019? Activity Log • Number of meetings with stakeholder team • Number of hours from Valve Coordinator to provide supervision of the program elements • Number of past TAVR patients who become certified volunteers</td>
<td>1. Checklist will quantify the tasks completed. 2. Checklist and activity logs will provide insight into program activities and provide information on whether or not the outcome was met. This information is important to note for replication of the program at another organization. 3. Provides insight into resources and time needed to make a TAVR peer support program successful.</td>
<td>Information of program task completed as noted by yes/no on checklist. No further analysis</td>
</tr>
<tr>
<td>2. At the medical center in the Pacific Northwest, a Decision Aid Tool is used 95% of the time with patients on the TAVR pathway work up from June of 2019 to Aug of 2019 and 80% of patients indicated the Decision Aid was helpful.</td>
<td><strong>Instrument:</strong> Activity log will provide a count of how often the Decision Aid Tool was used during the shared decision-making process in patients in the TAVR pathway. For the pilot project, the tool will be used during consultation with the interventional cardiologist and/or with patient visits with the Valve Coordinator.</td>
<td>1. Activity log will capture • If and when the tool was used • If patient information from the tool was shared at the multidisciplinary structural heart team meetings.</td>
<td>One on One interviews conducted by the project manager with TAVR program participants. Feedback will be aggregated and categorized by frequency of</td>
</tr>
</tbody>
</table>
Tool enhanced the shared decision-making process (PO).

| Preparation for Decision Making Scale Questionnaire. Uses ten questions to evaluate the if the patients found the aid helpful in assisting with SDM and scores them 1 to 5 on a Likert scale. The scale asks series of questions related to, did this educational material . . . and scores them one equals not at all through while 5 equals a great deal.

Interview question will be used to determine the common patient reported factors of using the Decision Aid Tool. The project manager will conduct interviews. The answers will be reviewed for commonalities and key elements that provide insight into what patients liked or did not like about the decision aid or shared decision-making process.

**Data:**

**Activity Log**
- Number of times valve coordinator provides patient with Decision Aid Tool at first contact
- Number of times Decision Aid Tool is used at consult with patient and Interventional Cardiologist
- Number of times use of Decision Aid tool documented in EHR
- Number of time Decision Aid tool information regarding patient information (goals/values) shared at bi-monthly Structural Heart Multidisciplinary clinical conference & documented in meeting notes

| Preparation for Decision Making Scale to evaluate the effect of the SDM aid
- Help you recognize that a decision needs to be made?
- Prepare you to make a better decision?
- Help you think about the pros and cons of each options?
| 2. Activity log provides insight into resources and time needed to incorporate a decision-making tool for shared decision making into the TAVR work up process.

| 3. Use of open-ended interview questions patients will indicate if the use of a Decision Aid Tool enhanced the shared decision-making process.
| 4. The use the decision-making scale will quantify the usefulness of the SDM tool and allow patients to provide feedback for how useful they found the tool.

| 5. Interview questions provides insight into the patient experience with the decision-making process for TAVR.
| 6. Data collection of the interview questions provide an opportunity for patients to give feedback on the shared responses. The information will be presented in a summary table for visualization of the feedback responses.
Help you think about which pros and cons are the most important?
- Help you know that the decision depends on what matters most to you?
- Help you organize your own thoughts about the decision?
- Help you think about how involved you want to be in this decision?
- Help you identify questions you want to ask your doctor?
- Prepare you to talk to your doctor about what matters most to you?
- Prepare you for a follow-up visit with your doctor?

Interview Questions
- How did the use of a decision aid enable you to engage with your physician during the TAVR work up process?

<table>
<thead>
<tr>
<th>Instrument</th>
<th>Activity logs will capture program actions completed by the Mended Hearts TAVR peers and the time they spend providing support. An interview question will be used with both Mended Hearts TAVR peer partners and new TAVR patients to gain insight into their experience with peer support.</th>
</tr>
</thead>
</table>
| Data:      | Activity Log
- Number of past TAVR patients that complete Mended Hearts training to become certified peer support partners
- Number of patients referred for TAVR peer support between May & Aug 2019

1. Activity log will capture the time and resource needs to provide peer support.

2. Log quantifies the number of past and new TAVR patients participating in the program.

3. The data provides insight into resources and time needed to incorporate peer support

One on One interview conducted by the project manager with TAVR program participants. Feedback will be aggregated and categorized by frequency of responses. The information will be presented in a summary table for visualization of the feedback responses.

3. At the medical center in the Pacific Northwest of the 4 past TAVR patients selected for training, 50% are trained and provide 1:1 peer support to patients in the TAVR work up process from June through August of 2019. (CO)

The patient feedback will be used to confirm the benefits of using a decision aid and/or make improvements to the aid and shared decision-making process.

</table>
| • Number of peer data collection forms completed by Mended Hearts TAVR peer  
• Data Collection Form for Mended Hearts TAVR peer  
  • Number of attempts to reach new TAVR patient by phone  
  • Number of minutes TAVR peer spent with new TAVR patient providing support and sharing TAVR experience  
Open Ended Interview Question  
  • Tell me about your experience with TAVR peer support. |   | 4. Interview question will provide data regarding the experience of Mended Hearts and new TAVR patients with peer support.  
5. Open-ended questions provide an opportunity for patients to share their experience in their own words. This information will be examined for common feedback elements that will be used to support, customize, and improve the intervention. |   |

4. At the medical center in the Pacific Northwest, 50% of patients who received peer support show a decrease in anxiety as evidenced by the General Anxiety Disorder-7 (GAD-7) scale by Sept 2019. (CO)  

**Instrument:**  
A pre-then-post design is used to compare anxiety before and after receiving peer support for patients in the TAVR work up process. The pre-then-post evaluation of anxiety is evaluated by the six questions, using the validated,  

**Data**  
The validated General Anxiety Disorder-7 (GAD-7) scale will be used.  
Patients are requested to rate  
  • Feeling nervous, anxious, or edge?  
  • Not being able to stop or control worrying?  

1. To quantify patient’s perception of anxiety in regards to the TAVR work up process  
2. Evaluate the impact of peer support in decreasing anxiety.  
3. Provides information to the stakeholders of the program regarding  
4. To quantify patient’s perception of anxiety in regards to the TAVR work up process  
5. Open-ended questions provide an opportunity for patients to share their experience in their own words. This information will be examined for common feedback elements that will be used to support, customize, and improve the intervention.  

**Descriptive statistics.**  
The GAD-7 was selected for its ease of use due to its short format, low cost, ability to collect the data in a timely manner and simplicity in scoring.
- Worrying too much about different things?
- Trouble relaxing?
- Being so restless that it is hard to sit still?
- Becoming easily annoyed or irritable?
- Feeling afraid as if something awful might happen to you?

If you checked off any problems, how difficult have these made it for you to do your work, take care of things at home, or get along with other people?

5. At the medical center in the Pacific Northwest, 50% of patients who received peer support show an increase in cardiac self-efficacy as evidenced by the Cardiac Self Efficacy questionnaire by Sept 2019. (CO)

**Instrument:**
The validated Cardiac Self-Efficacy Questionnaire measures self-efficacy in patients with cardiac disease. The questionnaire provides information on a patient’s confidence with knowing or acting on 16 items. The scale queries patient’s perception on control of symptoms and ability to maintain function.

**Data:**
The Cardiac Self-Efficacy (CSE) Questionnaire. The CSE uses a 13-item Likert-scale to measure patient’s cardiac confidence. The items are rated 0 through 4 (0= not at all, 1=somewhat confident, 2=moderately confident, 3 very confident, 4=completely confident) or may select “not applicable”.

**How confident are you that you know or can:**
- Control your chest pain by changing your activity level
- Control your breathlessness by changing your activity levels
- Control your chest pain by taking your medications
- Control your breathlessness by taking your medications
- When you should call or visit your doctor about your heart disease

1. Quantify patient’s perception on anxiety and Cardiac Self-Efficacy in regards to the TAVR work up process.
2. Evaluate the impact of peer support in increasing cardiac self-efficacy
3. Provides information to the stakeholders regarding effectiveness of Peer Support.

**Descriptive statistics**
The Cardiac Self-Efficacy questionnaire was selected for its targeting of questions related to self-efficacy of cardiac disease, low cost, ability to collect the data in a timely manner and simplicity in scoring.

Policy Implications

Policy sets practice and organizational standards that we must all adhere to and provides guidance for what and how something should be done (Mason et al., 2016). Cardiac surgeons or cardiac interventionalists may have a bias toward treatment options, and peer support and use of SDM aid can assist in neutralizing this bias. This DNP project has demonstrated that the use of peer support and the use of a shared decision-making (SDM) aids can be effective interventions to decrease anxiety and increase self-efficacy in the TAVR population while also enhancing the shared decision-making process which decreases bias of the presentation of treatment options.

The Center for Medicare and Medicaid Services (CMS) identifies SDM as an essential component of patient care and recommends it be a part of routine care for every patient (CMS, 2018). The CMS requirement for SDM in the TAVR population, works to improve quality, and ensure organizations are held to national standards of care. In the initial recommendations for the 2019 TAVR guidelines, it was proposed that the use of decision aids without commercial bias be used in the SDM process and be documented as part of the TAVR decision-making process between patients and their providers (Bavaria et al., 2018). The use of the SDM aids was not included in the 2019 CMS guidelines; however, the use of a SDM process was maintained as a core essential in the 2019 national coverage decision guidelines (CMS, 2019). The TAVR population is growing due to advances in medicine and changes in eligibility criteria allowing more people to be treated by TAVR. Next steps for policy should include further research with the TAVR population to validate the SDM aids and/or to improve upon the aids and to include their use in the CMS guidelines for all patients needing aortic valve replacement.
Appendix S

Dissemination

Preliminary project results were presented at the local Mended Hearts chapter meeting with approximately 50 community members present in August of 2019 and final results were presented at Boise State University in March of 2020. Due to changes in leadership at the pilot project site, the project was not presented to the Magnet Steering committee or Cardiovascular System Leadership team (Outcome 6). Instead, the project was presented in February 2020 at the project center’s Clinical Inquiry Council as this council tracks and provides a pathway for dissemination of all research and projects done at the medical center. A poster presentation was accepted for presentation at the April 2020 Western Institute of Nursing Research Information Exchange and at annual nursing conference at the project site in May of 2020. A manuscript is in progress and will be submitted in the spring/summer of 2020 to a selected journal.
